

HubSpot Account Audit

Findings & asset-cleanup workbooks for rePurpose Global (portal 6173040)

Prepared September 15, 2026 · reference date 2026-09-15 · "stale" = no activity since 2025-09-15

6,126	4,104	1,472	550	33%	6
Assets audited	Keep	Review	Remove candidate	Flagged (rev+rem)	Workbooks

Rating mix by asset type

Every asset in the account received a first-pass rating from its export metadata: **Keep** (in active use), **Review** (ambiguous — a human should decide), or **Remove candidate** (unused / turned off / orphaned — safe to delete after a final dependency check). Roughly one asset in three is flagged for attention; about 9% are remove candidates.

Key findings

The account is functional but carries a heavy layer of abandoned build artifacts — clones, never-used automations, empty drafts, and dashboards owned by staff who have left. The highest-value, lowest-risk wins are concentrated in a few places:

- **Turned-off workflows are the cleanest win.** All 182 workflows on the OFF tab are already disabled; 100 of them never enrolled a record or are test/clone/unnamed builds — safe to delete outright.
- **Custom properties are the biggest structural problem.** Of 886 custom properties, 186 are ~0% filled with zero references, and 606 more need review. The overall property "cleanup score" is 45/100, dragged down by Contacts (35), Companies (43) and Deals (48).
- **Marketing emails are cluttered with dead drafts.** 339 emails were never sent, including 170 old abandoned drafts and a run of "Template N" / "(Clone)" emails — 185 remove candidates in total.
- **Lists have a large unreferenced tail.** 455 of 1,006 lists are not referenced by any workflow, email or report; 261 are stale (>1yr). Most are recent, so they land in Review rather than automatic deletion.
- **Reports are healthy but 71 are orphaned.** Every report was opened within the past year, so placement drives the call: 71 sit on no dashboard at all.
- **Governance gap on dashboards.** 29 of 72 dashboards are owned by "User removed" (deleted accounts) and 11 have not been viewed in over a year — these need reassigning or deleting.

Ratings by asset type

Asset type	Total	Keep	Review	Remove cand.	% flagged	Workbook
Workflows	471	165	188	118	65%	RPG_workflows_AUDIT.xlsx
Properties	2,990	2,198	606	186	27%	RPG_property_audit.xlsx
Segments / Lists	1,006	538	440	28	47%	RPG_segments_audit.xlsx
Marketing Emails	1,000	664	151	185	34%	RPG_emails_audit.xlsx
Reports	587	508	58	21	13%	RPG_reports_audit.xlsx
Dashboards	72	31	29	12	57%	RPG_dashboards_audit.xlsx
TOTAL	6,126	4,104	1,472	550	33%	6 files

Percentages are of that asset type. "% flagged" = Review + Remove candidate. Workflows split across two tabs (ON / OFF) inside their workbook.

Method & how to read the workbooks

What "unused" means

There is no single "last used" field across HubSpot asset types, so each asset was rated from the strongest usage signal available in its own export. Ratings are deliberately conservative: when a signal was missing or mixed, the asset went to **Review** rather than Remove.

Asset	Primary "unused" signal(s) used
Workflows	Turned off (OFF tab); zero enrollments; not edited in >1yr; test/clone/unnamed name
Properties	Custom (non-default); fill rate ~0%; 0 asset references (from the source audit PDF)
Segments / Lists	Not referenced in any asset ("Used in"); stale >1yr; clone/test name
Marketing Emails	Never sent; draft age >1yr; not wired to a workflow; test/clone/template name
Reports	Not on any dashboard (dashboardCount=0); last-viewed date; clone/test name
Dashboards	Last-viewed >1yr; owner = "User removed"; clone/test name

The three ratings

Keep	In active use — running, enrolled, sent, referenced, viewed or pinned. Leave it.
Review	Ambiguous — unreferenced but recent, a possible duplicate, an orphaned owner, or a draft in progress. A human should decide.
Remove candidate	Unused, turned off, empty, orphaned or a clone/test. Safe to delete after a final dependency check .

Common layout of every workbook

- A **Summary** tab (front): rating totals plus breakdowns, in this same colour scheme, with a live formula so counts recompute if you edit them.
- A **data tab** listing every asset one per row, with the original columns preserved and audit columns added: **Rating** (colour-coded pill), **Assessment** (one-line reason), a per-asset flag (e.g. "Stale (>1yr)", "Orphaned"), and a blank **Your decision** column for your call.
- Filters are on and the name + rating columns are frozen, so you can sort by usage and scan ratings while scrolling.
- The colours match the original property-audit PDF: lavender = Keep, amber = Review, peach = Remove candidate.

Breakdown by asset type

1 Workflows

471	165	188	118
Total	Keep	Review	Remove

Findings. The account has 289 live (ON) and 182 turned-off (OFF) workflows. Every OFF workflow is already disabled — the clearest cleanup target — and 100 of them never enrolled a record or are test / clone / unnamed builds. Among live workflows, 165 are actively enrolling; the rest have never enrolled anyone or have gone quiet and untouched for over a year. Note: HubSpot exports "last edited", not "last enrolled", so recency is inferred from enrollment counts.

Workbook — RPG_workflows_AUDIT.xlsx. Your original two-tab file, data and hyperlinks intact, plus a front Audit Summary and four added columns on each tab (Rating, Assessment, "Stale (>1yr)", Your decision). The OFF tab's two scraped CSS-class headers were renamed to Enrolled total / Enrolled Unique.

2 Properties

2,990	2198	606	186
Total	Keep	Review	Remove

Findings. The 152-page property-audit PDF, converted to a working spreadsheet. Only custom properties are ever flagged (886 of 2,990); native HubSpot fields are always Keep. 186 custom properties are ~0% filled with zero references (safe removes) and 606 need review. The worst objects by cleanup score are Contacts (35/100), Companies (43) and Deals (48).

Workbook — RPG_property_audit.xlsx. Four tabs: Summary (per-object counts + a cleanup score that recomputes by formula — all 18 match the PDF), Flagged for Action (the 792 custom properties to remove/review, worst first), All Properties (all 2,990, sortable by Fill % / Uses / Rating) with blank Notes and Tag columns, and a How-to-use tab.

3 Segments / Lists

1,006	538	440	28
Total	Keep	Review	Remove

Findings. 1,006 lists. 538 are referenced by at least one asset (workflow, email, report or other list) and kept. 455 are referenced nowhere and 261 are stale (>1yr), but because most unreferenced lists were touched recently they land in Review rather than automatic deletion — that 440-strong Review pile is the "decide from here" bucket. Only 28 are clear removes (clone/test or unreferenced + stale).

Workbook — RPG_segments_audit.xlsx. A Summary tab (with Active-vs-Static and by-object breakdowns) and an All Segments tab: original columns, working hyperlinks, plus Rating, Assessment, "Stale (>1yr)" and Your decision.

4 Marketing Emails

1,000	664	151	185
Total	Keep	Review	Remove

Findings. 1,000 emails (782 published, 218 draft). Anything actually sent, or an automated email wired into a workflow, is kept (664). 339 were never sent — including 170 old abandoned drafts and a batch of "Template N" / "(Clone)" emails — giving 185 remove candidates; recent drafts and published-but-never-sent emails sit in Review.

Workbook — RPG_emails_audit.xlsx. A Summary tab (by publish status and send activity) and an All Emails tab. The export's 55 columns were trimmed to the 21 that matter for an audit (status, type, dates, sends, engagement rates, associated workflows, subject, preview link); the raw CSV still holds everything. Deleting sent emails erases their analytics, so all sent emails default to Keep.

5 Reports

587	508	58	21
Total	Keep	Review	Remove

Findings. The report export carried the best usage signals of all: last-viewed date and dashboard count. Every report had been opened within the past year, so the ">1yr unused" rule caught nothing — the real signal is orphan status: 71 reports sit on no dashboard. Pinned reports are kept; orphaned-but-recently-opened go to Review; clones, never-opened and orphaned-plus-unopened-6-months are removes.

Workbook — RPG_reports_audit.xlsx. A Summary tab (by dashboard placement and by customised-vs-default) and an All Reports tab. The per-asset flag here is "Orphaned (no dashboard)" instead of Stale, since that is the meaningful signal for reports.

6 Dashboards

72	31	29	12
Total	Keep	Review	Remove

Findings. 72 dashboards. The standout governance issue: 29 are owned by "User removed" — accounts that no longer exist — and need reassigning or deleting. 11 have not been viewed in over a year. Dashboards viewed within six months with an active owner are kept.

Workbook — RPG_dashboards_audit.xlsx. A Summary tab (by owner status and access level) and an All Dashboards tab. This was a browser-scraped export: the CSS-class headers were cleaned, relative dates ("Today at...", "Dec 1, 2025...") parsed against today, an all-zero noise column dropped, and the name links open each dashboard.

Suggested cleanup sequence

- 1. Clear the unambiguous junk first.** Delete the 100 OFF-tab remove-candidate workflows, "Template N" / "(Clone)" emails, clone reports/dashboards, and never-opened/never-sent items. Lowest risk, immediate declutter.
- 2. Fix governance.** Reassign or delete the 29 dashboards owned by removed users; retire dashboards unviewed >1yr.
- 3. Tackle custom properties.** Work the Flagged-for-Action tab worst-object-first (Contacts, Companies, Deals); delete the 186 zero-fill / zero-reference removes, then work the 606 reviews.
- 4. Work the Review piles last** — unreferenced lists, ad-hoc reports, in-progress drafts — using the "Your decision" column to record calls.

Important caveat

"Remove candidate" is a first pass from export metadata, **not a live dependency check**. An asset can read as orphaned yet still feed something the export does not show (a property used only in a report filter, a list feeding an integration, an email in a paused sequence). Before deleting anything, confirm in HubSpot's "Used in" / dependency view. Treat this report and the workbooks as a prioritised worklist, not an auto-delete list.
